                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in W08417-24 represent peptides derived from exosite I derived from factor VIII A3 domain. The exosite regions have low hydropathy values which reflects their hydrophilic nature. These peptides and fragments derived from them are cappable of binding-activated factor IX and its non-activated precursor. These peptides can be used for treating thrombootic disorders by inhibiting the intrinsic blood coagulation pathway. This peptide corresponds to Factor VIII A3 domain region 1786-1801.
exosite I derived from factor VIII A3 domain. The exosite regions have low hydropathy values which reflects their hydrophilic nature. These peptides and fragments derived from them are capable of binding-activated factor IX and its non-activated precursor. These peptides can be used for treating thrombotic disorders by inhibiting the intrinsic blood coagulation pathway. This peptide corresponds to Factor VIII A3 domain region 1799-1813.

These peptides and fragments derived from them are capable of binding-activated factor IX and its non-activated precursor. These peptides can be used for treating thrombotic disorders by inhibiting the intrinsic blood coagulation pathway. This peptide corresponds to Factor VIII A3 domain region 1804-1818.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

New isolated human guanosine 5'-mono.phosphate synthetase - used to develop prods. for its study and for identifying inhibitors useful for
                                                                                                                                                    digested with trypsin. When tryptic peptides were resolved. Their sequences are given in R83124-R83132 and are indicated on R83122 FF. Based on the peptide sequences, degenerate oligos were synthesised in both the sense and antisense orientations and used in PCR. A fragment was generated with oligos 252 and 8A2 (see T00493 FF). 252 & 8A2 corresp. to tryptic peptides 2 & 8. This PCR fragment (pcr. 258A) (see T00493 FF) was used to screen an A3.01 cDNA library. The complete sequence of positive clone 6 (GMPS.6 T00492) was determined and is shown in Figure 1 (T00493). The derived AA sequence (R83123) of human GMP synthetase is shown in Figure 1 (R83122). The predicted mol. wt. of the enzyme - 76,725 - was in good agreement with the size indicated by polyacrylamide gel electrophoresis of the purified A3.01 human GMPS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptides are claimed which contain at least 5 (pref. 5-20) amino acids and which include the sequence Ala-Lys-Pro-Arg. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences shown in W75807 to W75835 represent mouse mast cell protease (mMCD-6) susceptible peptides obtained in the absence of heparin. The invention provides sequences shown in W63160 to W63160 that are finhibitors of mMCP-6. These tryptase-6 complex inhibitor peptides can be used for treating a mast cell-mediated inflammatory disorder. The inhibitors can be used to treat inflammatory disorders including asthma, allergic rhinitis, urticaria and antioedema, eczematous dermatitis (atopic dermatitis), hyperproliferative skin disease, anaphylaxis, pepticuloges, inflammatory bowel disorder, hyperresponsiveness and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

The first control that comprises contacting host cells with immunological reagents specific for an epitope of HHV-6 variant A and/or B major immediate early protein (MIEP). HHV-6 peptides for raising an immunological reagent that binds specifically to an epitope of: (a) HHV-6 variant A and not B MIEP; or (b) HHV-6 variant A and B MIEP are also provided. The peptides are useful as immunological, reagents, e.g. hyperimmune sera. Monoclonal antibodies and recombinant DNA-derived single chain fragment variables (SCFV) may be useful for detecting HHV-6 infection when raised against specific epitopes of the HHV-6 of sensitivity and specificity. The methods also have shortened turns around time (compared to other known methods, e.g. the isolation of the virus in cell culture, the detection of virus DNA in an acellular specimen by PCR or positive immunohistochemical staining) and can be easily implemented by a diagnostic laboratory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sthods for the rapid detection of human herpes virus 6 variants A and utilizing antibodies raised against synthetic peptides \,

for detecting Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    An antibody, prepared using a partial peptide containing the phosphorylated residue of the phosphorylated tau protein, e.g. the present sequence, in a paired helical filament, can be used to detect Alzheimer's disease, i.e. by detecting phosphorylated tau protein in brain extracts or tissue fragments.
              The peptides suppress proliferation of myeloid progenitor cells and reduce susceptibility to septic shock. They are used to treat chronic myelogenous leukaemia or polycythemia, to reduce chemotherapy or radiation-induced myelosuppression, to prevent septic shock and to reduce nitric oxide-induced hypotension.
                                                                                                                                                                                                                  0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptides are claimed which contain at least 5 (pref. 5-20) ami acids and which include the sequence Ala-Lys-Pro-Arg. The present sequence is a specifically claimed such peptide.

The peptides suppress proliferation of myeloid progenitor cells and reduce susceptibility to septic shock. They are used to treat chronic myelogenous leukaemia or polycythemia, to reduce chemotherapy or radiation induced myelosuppression, to prevent septic shock and to reduce nitric oxide-induced hypotension.

The present sequence is the preferred peptide for clinical use.
                                                                                                                                                                                                                                                                                                                                                                            New peptide(s) that suppress myeloid progenitor cell proliferation - contain the sequence Ala Lys Pro Arg, useful for treating or preventing e.g. leukaemia, radiation induced myelosuppression and septic shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift mutation. The method is used to diagnose age-related diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, and littles typer II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may but caused by mutations in RNA rather than bNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including beta-amyloid precursor protein (beta-APP), the microtubule associated protein 2 (MAP2), neurofilament-1, neurofilament-1, neurofilament-1, neurofilament-1, neurofilament-1, neurofilament-1, neurofilament-1, neurofilament-1, presenilin II; presenilin II; HUPF-1, high mobility group
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Caps
                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing disease by detecting frameshift mutations in RNA or corresponding protein mutations – used to diagnose cancer and neurological diseases, particularly Alzheimer's disease, and also for treatment and prevention with specific ribozymes or wild-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HE4; epididymis-specific; diagnosis; male infertillity; treatment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

This represents the amino acid sequence of the framework 2 region of human V kappa gene HUM5400. This is used to consruct a humanised anribody LO-CD2a. The invention relates to the use of the monoclonal antibody (MAD) LO-CD2a or a humanised or a chimeric version of the LO-CD2a antibody for the inhibition of a T-cell mediated immune response in a patient. The MAD LO-CD2a (produced by hybridoma cell line ATC HB 11423) can bind to an epitope on the CD2 antigen of the human lymphocytes. The T-cell mediated immune response in a patient can be inhibited by administering the MAD LO-CD2a or an antibody that binds to the same human lymphocyte epitope as LO-CD2a. The method is used for preventing transplant rejection or for treating graft-versus-host disease or for treating autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Monoclonal antibody; MAb; LO-CD2a; humanised antibody; CD2 antigen; human lymphocyte; immune response; chimeric; graft-versus-host disease; T-cell; transplant rejection; autoimmune disease; HUM5400.

                                                                                                                                                                                                                                                                                                                                     This sequence represents a novel human epididymis-specific protein, HE4 epitope fragment. This protein may be used for Cloning and for expression of human epididymis specific polypeptides in prokaryotic or eukaryotic host cells. Such proteins and antibodies generated from them may be used for diagnosis of e.g. male infertility. The polypeptides and antibodies may also be used for treatment of male infertility and for immunosterilisation of mammans.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This peptide antigen is derived from the mature C-terminal domain of human articular cartilage-derived morphogenetic protein-1 (CDMP-1, R95635), and has been used to generate polyclonal antibodies in rabbits. The peptide does not show sequence identity with any other known protein, including bone morphogenetic protein. The resulting antibodies have been used to screen tissues from human embryos, to study differential CDMP gene expression. At 6 wk, CDMP-1 is detected in precartilage condensations, and at 7.5-8.5 wk CDMP-1 is found in cartilaginous cores of long bones. In areas of active cartilage degradation and bone matrix formation, CDMP-1 expression is also detected in hypertrophic chondrocytes. No expression is detected in the axial skeleton, and only low levels are present in other tissues. CDMP-1 is present in a purified cartilage extract (claimed) which stimulates local cartilage of commation and repair when combined with a matrix and implanted in a mammal. The protein may be used in therapy of e.g. chondromalacia or osteoarthritis, to heal joint surfaces, or to repair cartilage effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New purified cartilage extracts and proteins - used to stimulate the development and repair of cartilage in vivo.
                                                                                                                                                                                                                                                                                                                  Human, antigen: cartilage-derived morphogenetic protein-1; CDMP-1; polyclonal antibody: rabbit; articular cartilage; chondrogenic; vulnerary; implantation; chondromalacia; osteoarthritis; therapy;

specific affinity for an amino acid sequence encoded by a variant exon of the CD44 gene (pref. W01827 Itat) or W01828 [human]), and a second portion comprising at least part of the amino acid sequence of a subunit of the T-cell receptor complex or of an immunoglobulin receptor. Products contg. the fusion protein (or DNA encoding it) are useful for treating cancer, esp. mammary, colonic, gastric or pancreatic carcinoma, and metastatic disease.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NAUR dehydrogenase (EC 1.6.99.3) 49K chain - fava bean mitochondrion (frayment)
N.Alternate names: complex I 49K chain; NADH--ubiquinone reductase 49K chain
C;Species: mitochondrion Vicia faba (fava bean)
C;Date: 03-May-1994 #sequence_revision 07-0ct-1994 #text_change 17-Mar-1999
C;Accession: P00777
R;Leternae, S: Boutry, M.
Plant Physiol: 102, 435-443, 1993
A;Title: Purification and preliminary characterization of mitochondrial camplex I (NA A;Refence number: P00775; MUID:94151437
A;Accession: P00775; MUID:94151437
A;Accession: P00775; MUID:94151437
A;Molecule type: protein
A;Residues: 1-7 <LETP
C;Comment: Complex I, mitochondrial NADH-ubiquiquinone reductase, is the first of the ranging from 5K to 75K.
C;Comment: This enzyme catalyzes electron transfer from endogenous NADH to ubiquinone C;Genetics:
A;Genome: mitochondrion
C;Keywords: electron transfer; mitochondrion; oxidoreductase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           acetylcholinesterase (EC 3.1.1.7) P chain - bovine (fragment)

Fondetti, M.A.; Williams, N.J.; Sabo, E.F.; Pluscec, J.; Weaver, E.R.; Kocy, O. Blochemistry 10, 4033-4039, 1971

Biochemistry 10, 4033-4039, 1971

A; Title: Angiotensin-converting enzyme inhibitors from the venom of Bothrops jararaca. I A; Reference number: A90356; MUID:72118526

A; Accession: A01253

A; Molecule type: Drotein

A; Residues: 1-13 < CND>

A; Note: the structure of the peptide was confirmed by synthesis

C; Comment: This peptide also potentiates bradykinin by inhibiting the kinases that inact C; Superfamily: bradykinin-potentiating peptide

C; Superfamily: bradykinin-potentiating peptide

C; Superfamily: angiotensin-converting enzyme inhibitor; pyroglutamic acid

E; 1/Modified site: pyrrolidone carboxylic acid (Gln) #status experimental

Proc. Jpn. Acad., B. Phys. Biol. Sci. 46:176-181(1970)
-!- FUNCTION: THIS PEPTIDE BOTH INIBIRTS THE ACTIVITY UP THE BRADYKININ BY INHIBITING THE KINASES THAT INACTIVATE IT.

IT ACTS AS AN INDIRECT HYPOTENSIVE AGENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Xanthomonas campestris (pv. campestris).

CHLOROPLAST 30S RIBOSOWAL PROTEIN S18 ALPHA (FRAGMENT).
Spinacia oleracea (Spinach).
Chloroplast.
Eukaryota, viridiplantae; Embryophyta; Tracheophyta; Spermatophyta;
Garyophyllales; Chenopodiaceae; Spinacia.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 68,

                                                                                                                                                                                                                                                                                                                                            Sequence 6, Application US/08224917
Patent No. 5965350
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Lou, Lillian Lien-Li
APPLICANT: Barnett, Jimmy Wayne
TITLE OF INVENTION: Cloning and Expression of Human GMP
TITLE OF INVENTION: Synthetase, its use in Screening for Inhibitors of Human
TITLE OF INVENTION: GMP Synthetase and Inhibitors of Human GMP Synthetase
NUMBER OF SEQUENCES: 1
CORRESPONDENCE ADDRESS:
ADDRESSES: Syntex (USA) Inc.
STREET: 3401 Hillview Avenue
CITY: Palo Alto
STATE: California
                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;

ALIGNMENTS

R90945 standard; peptide; 13 AA. (first entry) 09-SEP-1996 RESULT R90945

Factor VIII antigenic peptide corresp. to residues Arg1652-Tyr1664.

Factor VIII; modification; inhibitor activity; binding; antibody; von Willebrand factor; immune disorder.

Synthetic.

                              modified Factor VIII in which residues Ala322-Ser750, Leu1655-Arg1689, Lys1694-Pro1782 and Asp2170-Tyr2332 are deleted. The modified Factor VIII and derived peptides can be used to prevent the activity of inhibitors of factor VIII binding to von Willebrand factor, esp. antibodies, thus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The synthetic peptide has a sequence based on regions of homology between Bordetella pertussis toxin S-subunits. The peptide acts as an analogue of the selectins ELAM, GMP140 and hLHR. Antibodies to this peptide can block the function of selectins and prevent the adherence of circulating cells to endothelial cells and inhibit inflammatory, metastatic or coagulation processes. The peptide also functions as a carrier to direct selected therapeutic agents to cells bearing selectin-specific receptors such as leukocytes, platelets or high endothelial veniles. The antibodies will further prevent binding of B. pertussis to eukaryotic cells such as ciliated cells and macrophages to interfere with the persistence of B. pervent binding of a host. In addition, the peptide can function as a vaccine to protect against B. pertussis infection.
               Peptides R90945-64 are derived from the factor VIII protein, esp. from a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        W06255-W06276 are immunoreceptor tyrosine-inhibitory motifs (ITIMs) that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   bind to protein tyrosine phosphatase IC (PTPID), PTPID, p160 or PTO and in doing so, inhibit signal transduction pathways involving these molecules. ITIM motif containing peptides can be used for regulating inflammatory and immune responses and for drug screening. The peptides can also be used to regulate haematopoietic cell function, especially antibody responses, blood clotting initiation, inflammatory responses, release of cytokines or mediators, or cytotoxicity and are useful for treating an immunoproliferative, immunodeficiency, autoimmune or infectious disease, cancer or allergic response. The peptides can also be used in the production of antibodies and in assays and diagnostics.

                                                                                                                                                                                                                                                                                                                                                                                                                                               The protein fragment was isolated for comparison with the rotavirus segment 8 protein fragment isolated from the Hu/Australia/5/11. The segment 8 product and fragments comprise at least part of the major outer capsid glycoprotein, they may be expressed from a transformed host and are useful as antigens for vaccination and diagnosis of the rotavirus.
                                                                                                                                                                                                                                                                                                                                                                              RNA gene segment coding for outer capsid glyco:protein of rota:virus - useful in expression of antigenic viral proteins by bacteria for use in vaccines and diagnostic prods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antiguals. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, remal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                associated antigen; diagnosis; research; treatment; human; cancer; colon cancer; gastric cancer; renal cancer; lung cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated cancer associated nucleic acids and polypeprides - isolated using sera from cancer patients, used to develop products

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product to a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

In such cells it exists in two isoforms, pp32 low and pp32 high. Both isoforms show rapid changes during T-cell activation. These changes take place within five minutes after stimulation of T-lymphocytes with monoclonal antibodies specific for CD2 or with phorbol esters. pp32 is useful for treating diseases of the immune system and to identify inhibitors of T-cell activation. Peptide fragments of pp32 (RB5073-81) were used to produce degenerate primers (T03911-19) which were then used to produce a probe to isolate a full length pp32 cDNA clone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                     Nucleic acid encoding a human pp32 protein which associates with CD45 - useful for treatment of immune system diseases and in the identification of T cell activation inhibitors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

Blocker; inhibitor; T-cell; T-helper cell; DR3; autoimmune diamate; type 1 diabetes; immunosuppression; Grave's disease; Sjorgens syndrome; myasthenia gravis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptides (R46052-6057) are specific examples of a generic formula. The peptides prevent the activation of salf-reactive T helper calls which lead to the destruction of "self" calls and tissues. The peptides bind to a particular HLA-DR molecule but are not recognised by the self-reactive T helper cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New peptide(s) which block self reactive helper T cells restricted to DR3, for treating or preventing autoimmune diseases, e.g., type I diabetes, without causing generalised immunosuppression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Similarity 57.1%; Pred.                                         The invention provides a human glucose-regulated munc protein, Hmuncl3, isolated from kidney. Host cells transformed with a vector comprising the Hmuncl3 gene are used for the recombinant expression of the protein. The Hmuncl3 gene is regulated by glucose. Hmuncl3 contributes to the renal and microvascular complications associated with hyperglycemia in diabetes mellitus. Hmuncl3 is used for apoptosis or vesicle trafficking. Hmuncl3, its gene or Hmuncl3 specific antibodies can be used in a kit for the Such disorders include insulin dependent and independent diabetes mellitus, glomerulopathy and (ischaemic) renal failure. A method using inhibitors (preferably an antisense nucleotide sequence Hmuncl3 gene) or activators of Hmuncl3 activity or its expression are useful in the treatment or detection of the above diseases. The present sequence treatment of the above diseases. The present sequence

                                                                                                                                                                                                                                                                                                                                                                     ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptides (R46052-6057) are specific examples of a generic formula. The peptides prevent the activation of self-reactive T helper cells which lead to the destruction of "self" cells and tissues. The peptides bind to a particular HLA-DR molecule but are not recognised by the self-reactive T helper cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptide(s) which block self reactive helper T cells restricted to DR3, for treating or preventing autoimmune diseases, e.g., type I diabetes, without causing generalised immunosuppression

R78824-R78853) and a lipid conjugated helper T cellinducing peptide. The compsn. induces a CTL response to bacterial, viral or tumour Ags, and is therefore useful in the treatment and prevention of diseases associated with the Ag.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Compsn. inducing cytotoxic T lymphocyte response to pref. viral, bacterial, parasitic or tumour antigens - useful in the treatment and prevention of diseases associated with the antigen e.g.

The peptides W54559-W54809 are examples of peptides to which at least I (preferably 2) mannose can be attached to increase their uptake as antigens by antigen-presenting cells. Uptake of agonist mannosylated peptides will increase the T cell response, whereas uptake of antagonist peptides blocks the T cell response. Blocking binding of immunogenic autoantigens can be used in treatment of type I diabetes, rheumatoid arthritis, graft rejection etc., also to induce T-cell non-responsiveness. Vaccines containing mannosylated antigen are used to prevent or treat infections by, e.g. bacteria, viruses, fungi, helminths and parasites.
                                                                                                                                                  Mannose; antigen; antigen-presenting cell; mannosylated peptide; {\tt T} cell; vaccine; treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Increasing uptake and presentation of antigen(s) - by adding mannose residue(s) to antigen for increasing T cell response, useful in, e.g. vaccines against viral infection(s)
                                                                            Peptide from P. falciparum CSP 368-375 b.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The peptides w54559-w54809 are examples of peptides to which at least 1 (preferably 2) mannose can be attached to increase their uptake as antigens by antigen-presenting cells. Uptake of agonist mannosylated peptides will increase the T cell response, whereas uptake of antagonist peptides blocks the T cell response. Blocking binding of immunogenic autoantigens can be used in treatment of type I diabetes, rheumatoid arthritis, graft rejection etc., also to induce T-cell non-responsiveness. Vaccines containing mannosylated antigen are used to prevent or treat infections by, e.g. bacteria, viruses, fungi, helminths and parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antigen; antigen-presenting cell; mannosylated peptide; T cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Increasing uptake and presentation of antigen(s) - by adding mannose residue(s) to antigen for increasing T cell response, useful in, e.g. vaccines against viral infection(s)

Oytochrome-c oxidase (BC 1.9.3.1) chain Va, hepatic - rainbow trout (fragment)
C.Species: Oncorhynchus mykiss (rainbow trout)
C.Species: Oncorhynchus mykiss (rainbow trout)
C.Species: Ooct-1994 #sequence_revision 01-Nov-1996 #text_change 18-Jul-1997
C.Accession: 543625
B.F.Feund, R.; Kadenbach, B.
Eur. J. Blochem. 221, 1111-1116, 1994
A.F.Itle: Identification of tissue-specific isoforms for subunits Vb and VIIa of cytochrd A.Reference number: 543624; MUID: 94237150
A.Accession: 543625
A.Molecule type: protein
A.Residues: 1-10 cFRE>
A.Note: the source is designated as Salmo gairdneri
C.Genetics: 1-10 cFRE>
A.Note: the source is membrane-associated complex; mitochondrion; oxidoreductase
